CAPABILITY STATEMENT

Corporate Overview

Ward ENG Support Services (WESS) is a software engineering and professional consulting services firm committed to providing high-quality service and helping customers achieve their business objectives through a combination of technologies, people and processes. Our success arises from our commitment to professionalism, collaboration, and the desire to consistently exceed our customers expectations

Core Capabilities

System Engineering WESS has proven experience supporting the acquisition of Information Technology capabilities for the Department of Defense, the Department of the Navy and the Defense Healthcare Agency during all phases of the acquisition lifecycle. We work with the system owners and vendors to ensure standardization of processes, while verifying that products are implemented using best practices.

Cybersecurity WESS coordinates efforts with the various program offices to ensure that the systems are prepared for the Certification and Accreditation efforts under the Risk Management Framework; this includes verifying compliance to STIGS, re-viewing and updating security artifacts, performing scans of the environments and reviewing mitigation and remediation strategies. WESS collaborates with the appropriate program offices to development metrics and requirements for new acquisitions.

Cybersecurity Development/Sustainment WESS has extensive experience in integrating cybersecurity measures within the system development process, coordinating corrective actions with the appropriate engineers, and performing patch and STIG management in order to ensure system compliancy.

Oracle Database Administration WESS has proven experience in managing Oracle Database instances, both standalone and Real Application Clusters.

Data Migration and Validation Services WESS ensures that data is correctly and effectively mapped, and that procedures are developed to ensure effective data loading. WESS produces comprehensive validation procedures that ensure data integrity of the information prior to going live.
